IT IS EASY TO SWERVE FOR SKIDDY!

Neveplast is counting on SKIDDY to revolutionize the world of karting and drifting. It is a great opportunity for managers in the recreational field. A unique emotion that will make anyone that tries it go crazy. A proposal aimed at a broad target audience as it entertains the skilled pilot, the amateur, and a child that has never been on a kart. Winter tracks have high operating costs and a season that lasts from 2-4 months.

With SKIDDY it is possible to satisfy the clients year round. The tracks can be opened both in the mountains as well as in the city, on the sands of the desert or on the beach. The temperature is no longer a problem as the “drift”, the controlled slide, can be done in complete safety. The operator who relies on Neveplast aims to invest in the entertainment world and targets all those that love to have fun in total security.

SKIDDY AND YOU ARE ALWAYS SIDWAYS

For the fans of drifting, for the kings of sliding, but also for those that do not understand much about counter-steering and motors, Neveplast presents an absolute novelty connected to the world of karts, SKIDDY. SKIDDY is a spectacular instrument for sliding karts in a secure and fun way both in the winter and the summer.

SKIDDY is made from a Neveplast pavement, a material that is specifically studied to have the unique characteristics of slipperiness in dry conditions with a high level of wear resistance. With SKIDDY you can skid, drift, counter-steer and pass on a low adhesion surface with low management costs and no need to maintain a layer of snow or ice.

DIMENSIONS OF THE TRACK

Unlike traditional kart tracks where in order to satisfy increasingly demanding clients with structures that are always larger and that require a high initial investment, the SKIDDY tracks promote smaller tracks as they are designed to keep the karts sideways for a long arc of travel. SKIDDY is not only for new tracks but also as extensions or completion of existing structures.

Alongside a traditional track you can amplify the possibilities for the guests, and thus the revenue,

without further increases in operating expenses. The proposed structures have dimensions that range from 100 to 200 meters. The special SKIDDY pavement is made from highly modular panels that give the possibility to realize ad hoc circuits that are secure and fun, in-line with the needs of the clients, and a great successful. The installation can be done on any compact and homogeneous surface.

KART MAINTENANCE

The use of a Neveplast surface brings enormous advantages also in the management of karts reducing to a minimum their costs. Tires never need to be changed as they are not consumed and also the wear on the karts is negligible compared to a traditional track.

ELECTRIC AND FUEL KARTS

SKIDDY tracks can be used interchangeably with both electric and fuel karts. With electric karts it is possible to regulate their performance enabling their use by both big and small racers while maintaining a high level of safety while having the maximum respect for the environment. The SKIDDY pavement has also been successfully tested with all wheel drive cars.

INDOOR AND OUTDOOR

Today with SKIDDY it is possible to realize tracks both indoors and outdoors with smaller dimensions compared to traditional tracks. These tracks guarantee success for the general public.

Neveplast produces: Ski and snowboard slopes - nordic ski tracks - summer and winter (snow) tubing
